

# Applied Statistics Qualifier Examination (Part II of the STAT AREA EXAM)

May 24, 2023; 11:15AM-1:15PM EST

## General Instructions:

- (1) The examination contains 4 Questions. You are to **answer 3 out of 4** of them. \*\*\* Please only turn in solutions to 3 questions \*\*\* **Please note that if you choose to do Question 4, you will have the flexibility to choose to do one of the three problems (4a, 4b, 4c) in that category, in this special transition period.**
- (2) You may use up to 4+2 books and 4+2 class notes, plus your calculator and the statistical tables.
- (3) NO computer, internet, cell phone, or smart watch is allowed.
- (4) ***This is a 2-hour exam 11:15am- 1:15 PM – Please turn in by 1:15pm.***

## Please be sure to fill in the appropriate information below:

I am submitting solutions to QUESTIONS \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ of the applied statistics qualifier examination. Please put your name on every page of your exam solutions, and add page number for solutions to each question individually.

There are \_\_\_\_\_ pages of written solutions.

## Please read the following statement and sign below:

Academic integrity is expected of all students at all times, whether in the presence or absence of members of the faculty. Understanding this, I declare that I shall not give, use, or receive unauthorized aid in this examination.

**1.** Suppose we have three independent random samples from three normal populations.  $X_1, X_2, \dots, X_{n_1} \sim N(\mu_X, \sigma_X^2)$ ,  $Y_1, Y_2, \dots, Y_{n_2} \sim N(\mu_Y, \sigma_Y^2)$  and  $Z_1, Y_2, \dots, Z_{n_3} \sim N(\mu_Z, \sigma_Z^2)$ . Two hypotheses are to be tested simultaneously:

$$H_0^A: 2\mu_X - \mu_Y - \mu_Z = 0 \text{ vs } H_1^A: 2\mu_X - \mu_Y - \mu_Z \neq 0$$

$$H_0^B: \mu_X + \mu_Y - 2\mu_Z = 0 \text{ vs } H_1^B: \mu_X + \mu_Y - 2\mu_Z \neq 0$$

**(a)** At an overall significance level  $\alpha = 0.05$ , derive the test statistics and decision rules for testing these two hypotheses.

**(b)** Suppose  $\sigma_X^2 = 2\sigma_Y^2 = 4\sigma_Z^2$  and the unequal sample allocation  $n_1 = n_2 = 2n_3$ , where  $\sigma_X^2$  is known. Derive the sample size formula to ensure a power  $>80\%$  at an overall  $\alpha = 0.05$  for testing the two hypotheses.

**2.** For a  $I \times J$  two-way contingency table with row and column random variables denoted as  $X$  and  $Y$ , one kind of association measure between  $X$  and  $Y$ , called  $\tau$ , is calculated based on the so-called variation measure

$$V(Y) = \sum_{j=1}^J \pi_{+j}(1 - \pi_{+j}) = 1 - \sum_{j=1}^J \pi_{+j}^2$$

- (a) Show  $V(Y)$  is the probability that two independent observations on  $Y$  fall in different categories.
- (b) Show that  $V(Y) = 0$  when  $\pi_{+j} = 1$  for some  $j$  and  $V(Y)$  takes maximum value of  $(J - 1)/J$  when  $\pi_{+j} = 1/J$  for all  $j$ .
- (c) For the proportional reduction in variation, show that  $E[V(Y|X)] = 1 - \sum_i \sum_j \frac{\pi_{ij}^2}{\pi_i}$ .

**3.** Let  $X_1$  be an  $n \times p_1$  matrix of known constants with  $0 < p_1 < n$  and  $\text{rank}(X_1) = p_1$ . Let  $X_2$  be an  $n \times p_2$  matrix of known constants with  $0 < p_2 < n$  and  $\text{rank}(X_2) = p_2$ . Let  $\text{rank}([X_1 \ X_2]) = p_1 + p_2$ ,  $p_1 + p_2 < n$ .

Let  $\beta_1$  be a  $p_1 \times 1$  vector of unknown constants. Let  $\beta_2$  be a  $p_2 \times 1$  vector of unknown constants. Let  $Y$  be an  $n \times 1$  vector of random variables with

$$E(Y) = X_1\beta_1 + X_2\beta_2.$$

The variance-covariance matrix of  $Y$  is  $\text{vcv}(Y) = \sigma^2 V$ , where  $V$  is a positive definite symmetric  $n \times n$  matrix. Find  $E[Y^T(I_{n \times n} - X(X^T X)^{-1}X^T)Y]$ .

**4a.** A research team has been hired by a county government to assess an education program using a three-stage nested design. There is an outcome measure of the quality of a student's work called  $Y$ . There will be a random sample of  $I=4$  school districts. There will be a random sample of  $J=6$  schools within each district. There will be a random sample of  $K = 2$  classes within each school. Finally, there will be a random sample of  $R = 8$  students from each class. The researchers will use the model:

$$Y_{ijk r} = \mu + A_i + B_{j(i)} + C_{k(ij)} + \sigma_E Z_{(ijk)r}$$

The random variables  $\{A_i\}$  are normally and independently distributed with expected value 0 and variance  $\sigma_A^2$ . The random variables  $\{B_{j(i)}\}$  are normally and independently distributed with expected value 0 and variance  $\sigma_B^2$ . The random variables  $\{C_{k(ij)}\}$  are normally and independently distributed with expected value 0 and variance  $\sigma_C^2$ . The random variables  $\{Z_{(ijk)r}\}$  are independent and identically distributed normal random variables with mean 0 and variance 1. The sets of random variables  $\{\{A_i\}, B_{j(i)}, \{C_{k(ij)}\}, \{Z_{(ijk)r}\}\}$  are independent of each other.

The research team believes that  $\sigma_A^2 = 30, \sigma_B^2 = 40, \sigma_C^2 = 50, \sigma_E^2 = 80$ . What is the test of the null hypothesis that  $\sigma_A^2 = 0$ ? Specify its null and alternative distributions. Find the probability of a Type II error for this test using level of significance 0.01. under the specification given above.

**4b.** Consider the VAR (1) model:

$$\begin{pmatrix} Y_{1,t} \\ Y_{2,t} \end{pmatrix} = \begin{bmatrix} 0.7 & 0.1 \\ 0.1 & 0.7 \end{bmatrix} \begin{pmatrix} Y_{1,t-1} \\ Y_{2,t-1} \end{pmatrix} + \begin{pmatrix} \epsilon_{1,t} \\ \epsilon_{2,t} \end{pmatrix}, \text{ where } \begin{pmatrix} \epsilon_{1,t} \\ \epsilon_{2,t} \end{pmatrix} \text{ i.i.d. } \sim \left( \begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 & 0.5 \\ 0.5 & 1 \end{bmatrix} \right)$$

**(a)** Is this model in structural or reduced form? Please justify your answer.

**(b)** Is this VAR(1) series stationary? Please show the entire derivation.

**(c)** Please derive the symmetric structural form of this VAR(1).

**(d)** Please derive the asymmetric structural form of this VAR(1) using the Cholesky decomposition. Please make sure that in this form,  $Y_{1,t}$  would depend on  $Y_{2,t}$ , while the other way is not true.

Name: \_\_\_\_\_
