Join us on December 2, 2021 for an engaging workshop that will explore:

- Integration of multiple bioimaging technologies to advance our understanding of medical and biological problems,
- Algorithms, tools and experimental systems designed to carry out multi-resolution, multi-modal analyses of specimens, living systems and materials,
- Computational/AI methods for creating integrated views from multiple data acquisition platforms, and
- Methods that make use of integrative data to make predictions about patient response to treatments or to behavior of experimental systems after various interventions.

This workshop will spur development of collaborative teams to tackle ambitious problems in
biomedical science and engineering.
